# PARROT BREEDING STIMULATION PROGRAM

Dr Ockert Botha (BVSc)

## ***Introduction:***

The aim of this program is to effectively treat one of the most common underlying sub clinical diseases that will cause poor breeding or hatchability in parrots and parakeets. Psittacosis caused by Chlamydophylia (Chlamydia) is endemic in many aviaries and is often impossible to eradicate fully. Regular preventative treatment is recommended to reduce the incidence and symptoms of this disease.

It is imperative to treat this disease for 40 days. The product of choice is AvioDox used at 5 gram per kg of soft food and 5 gram per litre of drinking water. AvioDox contains 5% Doxycycline combined with essential vitamins.

In the program we combine AvioDox with AvioGel to prevent Candida and E-Coli overgrowth via the Apple Cider Vinegar and Grape Fruit Seed Extract that it contains. **We also strongly advise the use of AvioEntroMune to supply pro-**

Poor breeding performance and hatchability may also be a result of marginal deficiencies of certain key nutrients.

Fertical is a unique supplement that supplies 3 different forms of Calcium as well as Vitamin D3 and Magnesium for maximal Calcium absorption. It also contains Co-Enzyme Q10 that has been proven to stimulate the sperm production and libido of birds and 2 x plant extracts that has a very specific stimulatory effect on breeding and fertility. Over and above these it also contains Beta Carotene and Vitamin E that are known to stimulate fertility as well as Whey Protein and Colostrum to ensure perfect health and growth of chicks.

Multibreed is an exceptional combination of vitamins and other key elements to ensure healthy birds and optimal breeding results.

Iodine is the most important regulator of the reproductive hormones via the action of the Thyroid gland. Addition of AvioBludform to the drinking water will ensure that birds receive the correct amount of the most bio-available and safe Iodine as well as the other extremely important trace elements.

## ***The Program:***

### **First 40 days:**

Treat all birds with 5 grams of AvioDox per kilogram of soft food and 5 grams of AvioDox per litre drinking water continuously.

Combine the AvioDox with AvioGel and AvioEntroMune on Mondays, Wednesdays and Fridays in the soft food at the recommended dosage.

Combine the AvioDox with Fertical on Tuesdays and Saturdays.

Combine the AvioDox with Multibreed on Thursdays and Sundays.

**Follow up for the rest of the breeding season:**

Add AvioGel and Multibreed to the soft food on Mondays and Wednesdays.

Add Fertical to the soft food on Tuesdays, Thursdays and Saturdays.

Add AvioBludform to drinking water every Friday.

Add Feather and Immune Oil to soft food on Mondays and Wednesdays.
